Tarea Ejemplo

Diseñar un ciclo de Carnot que pueda operar a condiciones de Laboratorio donde

$$T_C = 298.15\text{K} \quad T_F = 273.15\text{K} \quad p_1 = 0.771 \text{ atm (586 mmHg)}$$

$$n_1 = 1 \text{ mol gas diatómico } \gamma = 1.4$$

Resolución

A) Cálculo de variables

$$V_1 = \frac{(1 \text{ mol}) (0.082 \text{ atm} \cdot \text{L} / \text{mol} \cdot \text{K}) (298.15 \text{ K})}{0.7710 \text{ atm}} = 31.709 \text{ L}$$

$$V_2 = 2V_1 = 2(31.709 \text{ L}) = 63.418 \text{ L}$$

$$T_1 = 298.15 \text{ K}$$

$$T_2 = T_1$$

$$T_3 = T_4 = 273.15 \text{ K}$$

$$V_3^{\gamma-1} = \frac{T_3}{T_2} V_2^{\gamma-1} = \frac{273.15 \text{ K}}{298.15 \text{ K}} (63.418 \text{ L})^{1.4-1}$$

$$V_3 = 78.940 \text{ L}$$

$$p_2 V_2 = p_1 V_1 = p_2 = p_1 \left(\frac{V_1}{V_2} \right) = 0.7710 \text{ atm} \left(\frac{31.709 \text{ L}}{63.418 \text{ L}} \right) = 0.3855 \text{ atm}$$

$$p_3 V_3^\gamma = p_2 V_2^\gamma$$

$$p_3 = p_2 \left(\frac{V_2}{V_3} \right)^\gamma = 0 = 0.3855 \text{ atm} \left(\frac{63.418 \text{ L}}{78.94 \text{ L}} \right) = 0.2837 \text{ atm}$$

De la relación

$$\frac{V_2}{V_1} = \frac{V_3}{V_4} = V_4 = \frac{V_1 V_3}{V_2} = \frac{(31.709 \text{ L})(78.940 \text{ L})}{(63.418 \text{ L})} = 39.47 \text{ L}$$

$$p_4 = \frac{p_3 V_3}{V_4} = 0.2837 \text{ atm} \left(\frac{78.94 \text{ L}}{39.47 \text{ L}} \right) = 0.5674 \text{ atm}$$
